

PLANE CRASH

LEVEL: B1+

For several days, Maria stayed near the crash site. She was weak, hungry, and losing strength, but she did not move far because she hoped rescuers would find the plane. Every sound in the sky made her heart beat faster. She waved pieces of fabric and tried to make signs on the ground. Finally, after almost a week, a rescue helicopter saw the broken plane and landed nearby. When the team found Maria holding her newborn baby, they were shocked. The doctors said that both mother and child were in very serious condition, but alive. They were immediately taken to a hospital, where they received medical care.

The story quickly spread through the news around the world. Many people called Maria a hero. Doctors said that surviving a crash, giving birth alone, and keeping a newborn alive in such conditions was almost a miracle. Psychologists explained that in extreme situations, the human body and mind can find hidden strength, especially when a person is fighting for another life.

Maria later spoke about the emotional impact of the experience. She said that she still had nightmares and felt afraid when she heard loud noises. However, she also said that the experience changed her forever. She felt stronger, more grateful, and more aware of how fragile life is. Holding her healthy baby in her arms, she felt that she had been given a second chance.

This true story shocked the world because it showed the extreme power of survival and maternal instinct. Alone, injured, and without any help, a woman faced nature, fear, and pain, and still managed to bring new life into the world. It reminds us that in the most hopeless situations, human courage and the will to live can be stronger than we ever imagine.
